

AI Applications – Flashcards

Q: What is Artificial Intelligence (AI)?

A: AI refers to systems designed to perform tasks that typically require human intelligence, such as reasoning, problem-solving, perception, and language understanding.

Q: What is Responsible AI?

A: The ethical use of AI systems with an emphasis on fairness, transparency, and accountability.

Q: What are AI workloads?

A: Core functional areas of AI systems built on machine learning.

Q: List key AI workloads.

A: Generative AI, Agents and Automation, Speech, Text Analysis, Computer Vision, and Information Extraction.

Q: What is Machine Learning (ML)?

A: A method of achieving AI where systems learn patterns from data without explicit programming.

Q: What is supervised learning?

A: Machine learning using labeled data to predict outcomes or classify information.

Q: What is unsupervised learning?

A: Machine learning that identifies patterns in unlabeled data, such as clustering.

Q: What is deep learning?

A: A specialized branch of machine learning using multi-layer neural networks to model complex patterns.

Q: What is Generative AI?

A: AI that uses deep learning to create new content such as text, images, audio, or code.

Q: What is an AI application?

A: Software that uses AI techniques to perform tasks requiring human-like intelligence.

Q: Why are AI applications dynamic?

A: They can improve over time through retraining or fine-tuning of models.

Q: How do users interact with AI applications?

A: Through conversational interfaces, embedded features, decision support systems, and automation.

Q: Give an example of AI in healthcare.

A: Medical image analysis tools that assist doctors in detecting diseases.

Q: Give an example of AI in finance.

A: Fraud detection systems that monitor transactions in real time.

Q: Give an example of AI in education.

A: Intelligent tutoring systems that adapt to individual learning styles.
